

Product Ready for Pre-Order: Backed by Strong Science for Alzheimer's, Parkinson's, and Multiple Sclerosis

Funded by the Alzheimer's Association and based on over 10 years of research.

TEMECULA, CA, NOVEMBER 18, 2019 - Prodrome Sciences is now taking pre-orders for Prodrome-Neuro Plasmalogen Oil, a natural supplement to raise levels of critical plasmalogen molecules scientifically linked to neurodegenerative diseases. Prodrome-Neuro Plasmalogen Oil is funded by the Alzheimer's Association for a clinical trial in Alzheimer's patients and is backed by over 10 years of research.

Prodrome-Neuro Plasmalogen Oil, currently available for research use only, is scientifically designed by Prodrome Sciences' founder, Dr. Dayan Goodenowe, to effectively and safely elevate levels of plasmalogens. The research supporting insufficient plasmalogens in the cause of neurodegenerative diseases such as Alzheimer's, Parkinson's, and multiple sclerosis is extensive. Plasmalogens are critical lipid (fat) molecules needed for brain and nerve health. Levels can reduce with age to less than what the brain needs.

Prodrome Sciences is taking pre-orders for the personal use Plasmalogen Oil product, anticipated for release by September 2020.

HIGHLIGHTS

- #1: Funded by the Alzheimer's Association (PCTR-16-381605) 
- #2: Accepting pre-orders now for release by September 2020
- #3: Backed by strong science
- #4: Scientifically designed for optimal activity in the body
- #5: Safe, natural, and effective

"I am very happy to be able to offer this natural plasmalogen supplement to anyone concerned about their neurological health. I have been personally taking the supplement for over a month now and have already noticed a significant neurological improvement - my vision is better," said Dr. Goodenowe, Founder and CEO of Prodrome Sciences. "My personal experience just further reinforces the importance of making sure that plasmalogen supplementation is made available to everyone."

Plasmalogen supplementation could be the key to finally address the root cause of neurodegenerative diseases after all other targets have failed to benefit patients. Dr. Goodenowe first published his research about the role of plasmalogen deficiency in the cause of dementia in 2007. Since then, the role of plasmalogen deficiency in disease has expanded to include Parkinson's and multiple sclerosis. Plasmalogens are

a critical part of nerve cells are also powerful antioxidants and anti-inflammatory molecules.

Recent clinical trial results from the Rush University Memory and Aging Project showed that people with high blood plasmalogen levels had lower rates of dementia, were 80% less likely to develop dementia over six years, and were less likely to die in five years. Plasmalogen supplementation prevents neurodegeneration and improves neurological function in animal models of neurodegenerative diseases.

Dr. Goodenowe believes that health solutions should be accessible and affordable - and most importantly safe and effective. He scientifically designed Prodrone-Neuro Plasmalogen Oil to have optimal activity in the body for maximum effectiveness. Dr. Goodenowe spent many years inventing, developing and testing drugs. He is now focused on designing and developing natural products with the same high standards of pharmaceuticals for the best of both worlds: natural and effective.
